

Agentforce & AI

Build, ground, and deploy autonomous AI agents on the Salesforce Platform.

What Is an Agent

An **Agentforce** agent is an LLM-powered assistant that reasons over a request, routes it to a **subagent**, and runs **actions** to complete work – grounded in your Salesforce data and protected by the Einstein Trust Layer.

Building Blocks

- Agent** – the assistant, its role and instructions.
- Subagent** – a job area with a scope + instructions. Called a **Topic** before April 2026; metadata type is still `GenAiPlugin`.
- Action** – a concrete capability the agent can run.
- Instructions** – natural-language guidance to the model.

Subagents (Topics)

- The **Atlas Reasoning Engine** classifies each request into **one subagent**.
- Each has a **scope**, **instructions**, and assigned actions.
- Keep them distinct and non-overlapping to avoid mis-routing.
- “Topic” is the pre-April 2026 name; functionality is unchanged.

Actions

TYPE	BACKED BY
Apex	<code>@InvocableMethod</code> or REST
Flow	Autolaunched flow
Prompt Template	Grounded LLM prompt
External Service	OpenAPI / HTTP
MuleSoft	MuleSoft API

Prompt Templates

- Types: **Sales Email**, **Field Generation**, **Record Summary**, **Record Prioritization**, **Flex**.
- Ground with merge fields, related lists, and Data 360.
- Build and test in **Prompt Builder** before wiring to an action.

Agent Script (.agent)

- The modern way to author agents: `.agent` files (**Agent Script**) packaged as `AiAuthoringBundle` metadata – **GA since Feb 2026**.
- Indentation-based blocks – `system` / `config` / `variables` / `start_agent` / `subagent` – mixing `if/else` logic with `|` prompt lines.
- Scaffold with `sf agent generate authoring-bundle`; `sf agent create` is the legacy path.

Full syntax on the **Agent Script** cheatsheet.

sf CLI

```
sf agent generate agent-spec
sf agent generate authoring-bundle --spec spec.yaml
sf agent preview --api-name My_Agent
sf agent test run --api-name My_Suite
```

- The authoring-bundle flow builds an Agent Script `.agent`; `sf agent create` is the legacy (non-Agent-Script) path.

Grounding & RAG

- Ground answers in CRM records, Knowledge, and **Data 360** retrievers (Data Cloud was rebranded Data 360 in Oct 2025).
- Retrieval-augmented generation keeps responses factual and current.

Testing

- Define suites with `AiEvaluationDefinition` (test spec YAML).
- `sf agent test run` asserts topic + action selection and outputs.
- Add red-team cases for prompt injection and jailbreaks.

Einstein Trust Layer

- Zero data retention with the model provider.
- Toxicity detection + prompt-injection defense.
- Full audit trail of every generation.
- Note: field/pattern **data masking is disabled for agents** – protection relies on zero-retention.

Deploy & Observe

- Agents are metadata – ship via `sf project deploy`.
- Activate, assign, and manage in **Agentforce Studio**.
- Monitor production sessions to catch regressions early.
